

SE – Project Deliverable (D1)

The objective of the Group Agreement (D1) is to make sure that everyone in the group is on the same page and ready to work collaboratively. This document will be saved by the facilitators and will be used as “agreed arbitration” in the unlikely case there is some conflict in the group.

If you all agree to update the document during the course to better reflect how the group is organized, you can do it with the approval of all the members.

To help you build the document, here there is an open list of topics you should discuss, agree and reflect in the D1 document:

- a. Who are each of you and what expertise you bring to the team.
- b. What is your individual interest (if any) in the course?
- c. What grade do you aim to get in this course?
- d. What role/s each team member will take, and what are the concrete responsibilities for each role.

Advise 1: remember that in this course the software coding is just the means, not the final goal. You should be more interested in developing group dynamics, learning how to elicit and specify good requirements, formulate, and execute good plans, how to integrate different designs etc. Therefore, we strongly recommend that you DO NOT divide the team on “developers/coders/testers” and “documenters”.

- a. Are roles static (everyone will have the same role(s) for the entire project) or fluid (you will change roles during the course)? When and how you are going to make changes, if any?

Advise 2: To get the most out of the course, we strongly encourage you to take on different roles, even if that means putting yourself outside your zone of comfort.

- a. What communication/collaboration tools are you going to use besides Trello? How?
- b. Other specific rules agreed between the members of the team (e.g., how meetings are organized)
- c. How you want to proceed in the unlikely case there is/are some free-rider/s in the team?
- d. When and how are you going to collaborate?
- e. Make sure you discuss as a group the rest of registration assignments.
- f. And finally, a set of initial tasks.

SE – Project Deliverable (D2)

The objective of the Requirements Elicitation (D2) is to outline the *user requirements (sometimes called initial requirements) of the component – game platform or game AI - your team has elicited* during the short Sprint 1. To help you understand what it is expected in the D2, below you can find a detailed outline of all the sections you can provide, with some examples of the content expected.

1. Scope statement

The **scope statement** section of the requirements should briefly describe the purpose of the current document and to summarize its content in natural language. While doing so, you should briefly introduce the client. For example, the scope statement of a D2 document for an Anti-cyberbullying System could be this:

This document outlines the requirements for an Anti-cyberbullying System (ACS) for the new Studium platform at Uppsala University.

Punjab University is a large university in Lahore, Pakistan. Founded in 1839, it is the oldest university in Pakistan. It ranks among the world's 500 best universities in several high-profile international rankings [1].

The recommended size of this section is between 1 and 3 paragraphs.

2. User classes

The **user classes** section provides a description of each one of the customers that will use the product directly or indirectly (aka users or end users). You can write the description normally, or even better, as user personas. The important thing is that the description should be representative of the type of end user that will be using the product that you are building.

For example, a software engineering team building a Chemical Tracking System, might describe one of its end users as follow:

Fred, 41, has been a chemist at Contoso Pharmaceuticals since he received his Ph.D. 14 years ago. He doesn't have much patience with computers. Fred usually works on two projects at a time in related chemical areas. His lab contains approximately 300 bottles of chemicals and gas cylinders. On an average day, he'll need four new chemicals from the stockroom. Two of these will be commercial chemicals in stock, one will need to be ordered, and one will come from the supply of proprietary Contoso chemical samples. On occasion, Fred will need a hazardous chemical that requires special training for safe handling. When he buys a chemical for the first time, Fred wants the material safety data sheet emailed to him automatically. Each year, Fred will synthesize about 20 new proprietary chemicals to go into the stockroom. Fred wants a report of his chemical usage for the previous month to be generated automatically and sent to him by email so that he can monitor his chemical exposure.

*Note that this is written as a **User Persona**. The recommended size of this section is between 1 and 2 paragraphs for each end user.*

3. User requirements

The **user requirements** section provides a (usually numbered) list of requirements, as they are expressed by the client. They are concise and concrete.

Back to the Anti-cyberbullying System, a possible set of user requirements describing the actions of the "admin" stakeholder could be:

REQ-ADMIN1. An administrator needs to have access to the evidence of all moderators' classrooms belonging to the same school so it can decide when to ban a student.

REQ-ADMIN2. The administrator needs to be able to create pre-defined CBF templates, so moderators can choose one or another depending on the type of forum.

REQ-ADMIN2. The administrator needs to be able to edit pre-defined CBF templates, so they can be adapted to the moderators' needs.

REQ-ADMIN3. The administrator needs to be able to delete CBF templates if they are no longer useful.

REQ-ADMIN4. The administrator needs to be able to enable pre-defined CBF templates, to limit the moderators' choices.

REQ-ADMIN5. The administrator needs to be able to disable pre-defined CBF templates, to limit the moderators' choices.

This section does not have a recommended size, but the more complete is your list of user requirements the easier will be for you to prototype your solution, produce the system requirements in D3 and move forward the Sprint 2.

You **must** write the user requirements in the format of **user stories**

- Changelog

If the document is not the first version, provide a list of the changes that have been applied since the last deliverable. For example, Team Z has delivered a 3rd version of the document:

Version	Date	Change
v1	2022-10-05	Initial version
v2	2022-10-17	Added REQ-ADMIN-3 Added REQ-ADMIN-4 Added REQ-ADMIN-7 Deleted REQ-ADMIN-14 Modified REQ-USER-5 Modified REQ-USER-6 Improved description of USER Added description of ADMIN
v3		

- Grading – Individual Contributions

This first submission does not have an individual grading.
